# GEOMETRICAL MODELLING FOR AN AUTOMATED FACETING MACHINE

## INTRODUCTION

### Brazilian Gem Market

- **Biggest world-wide concentration of agate, amethyst and citrine;**
- **Most of Brazilian gems are exported in rude form to be benefited in others countries (USA, China, India);**

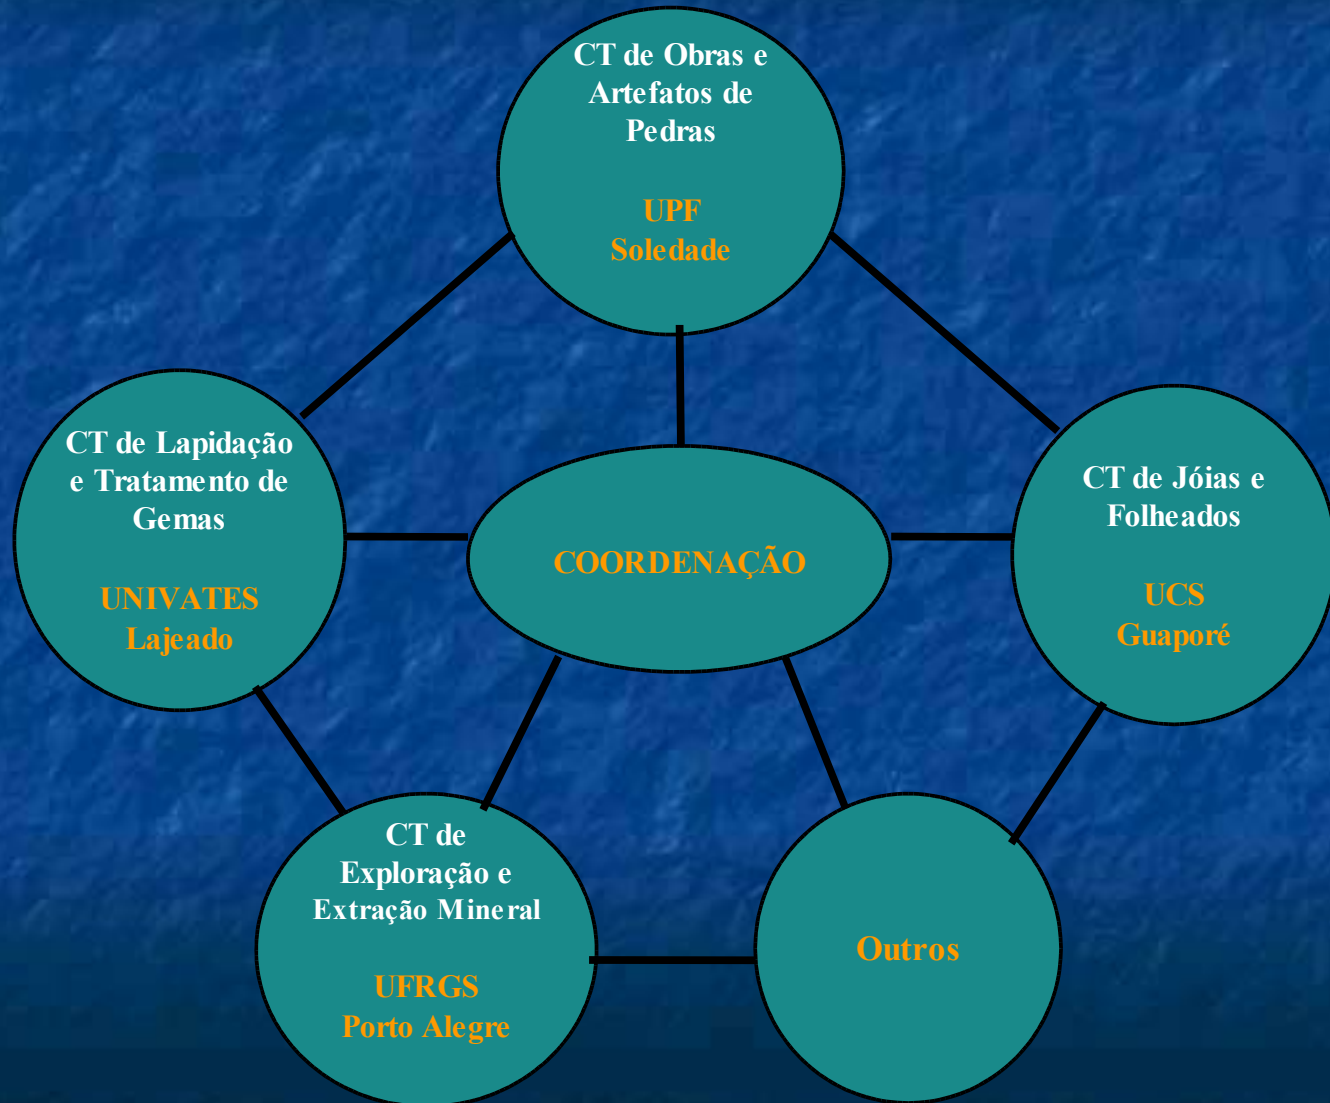

# GEOMETRICAL MODELLING FOR AN AUTOMATED FACETING MACHINE

## Current Situation in Brazil

- **Low percentage of country's gems are lapidated**
- **Lapidated gems are out of internacional standards**
- **Jewelry industries import calibrated and standardized gems**
- **Difficulty to compete with asian lapidation industries**
- **Outdated technology**

# GEOMETRICAL MODELLING FOR AN AUTOMATED FACETING MACHINE

## Gems and Jewels Technologic Network in RS

# GEOMETRICAL MODELLING FOR AN AUTOMATED FACETING MACHINE

## Annual Production of Gross Material in RS

- Amethyst: 4.700 ton (Ametista do Sul)
- Agate: 6.470 ton (Salto do Jacuí)
- New fields: Quaraí, etc...

Agate Export in gross: 70%

Amethyst Export in gross: 90%

Stone Artefacts  
Lapidated

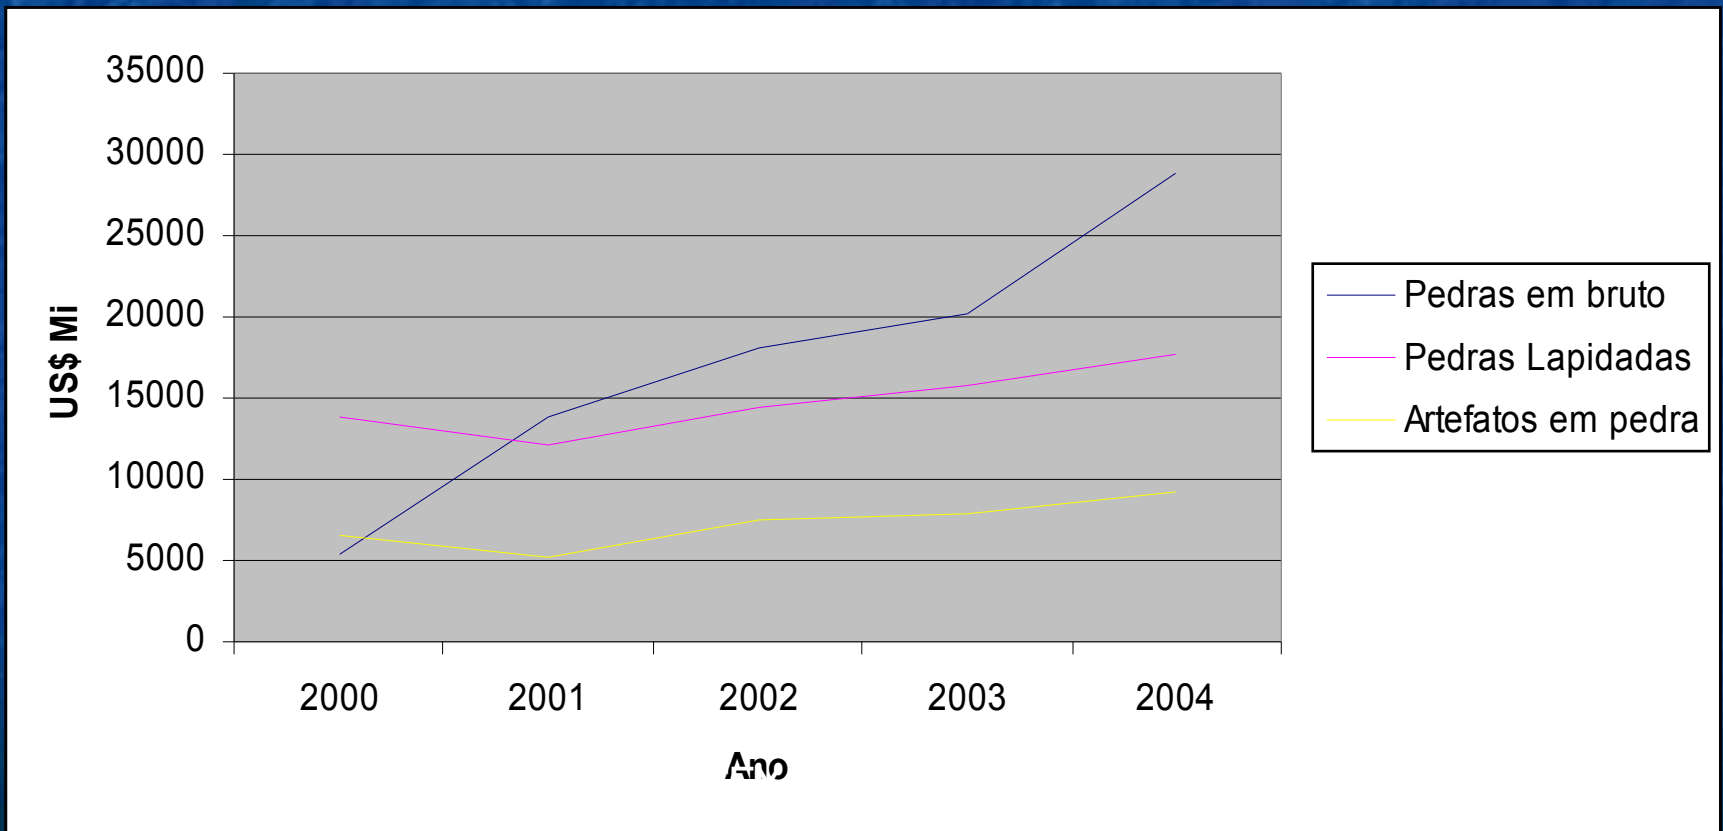

Amethyst 10%

Agate 30%

## Gem, Jewels and Stone Artifacts Exports from RS

# GEOMETRICAL MODELLING FOR AN AUTOMATED FACETING MACHINE

## Competitiveness Parameter

China, september/2004

- **Average salary for a Lapidary: US\$200**
- **Lapidation Technology: Lee machines (1950)**
- **Production: 61 stones/day/lapidary**

Source: Geologist Wallid El Koury Daoud

# GEOMETRICAL MODELLING FOR AN AUTOMATED FACETING MACHINE

## LAPIDATION TECHNOLOGY DEVELOPMENT

- **Cabuchon Lapidation:**

Technology developed by industry, proven and in process of dissemination.

- **Faceted Lapidation:**

Greater complexity → Interaction university-industry.

# GEOMETRICAL MODELLING FOR AN AUTOMATED FACETING MACHINE

## Faceted Lapidation

- Brazil uses manual technology
- High dependence on manual hability =  
Lack of standardization in lapidation  
Low volume produced
- Lapidary salary US\$ 600 a 800 =  
High production cost

“Bottleneck” in production

# GEOMETRICAL MODELLING FOR AN AUTOMATED FACETING MACHINE

## Automated Lapidation

### Advantages:

- Operator independence
- Standardization of pieces
- Less production time
- More complex lapidations

Less cost = more competitiveness

# GEOMETRICAL MODELLING FOR AN AUTOMATED FACETING MACHINE

## Automated Lapidation

### Challenges:

- Development of local technology
- Innovative design, patent required in feb/05
- Multidisciplinary research: mechanics, electric, computing and gemology
- Integration university - industry
- High precision positioning: few  $\mu\text{m}$
- Ruggedness for stone industry environment

# GEOMETRICAL MODELLING FOR AN AUTOMATED FACETING MACHINE

## FACETING MACHINE CONCEPTION

### Main Goal

Perform automatic semiprecious gemstones faceting through the interpretation of a predefined cutting procedure list.

# GEOMETRICAL MODELLING FOR AN AUTOMATED FACETING MACHINE

## Automatic Faceting Machine for Gems and Jewels

### Capability of machine:

- Production capability foreseen:  
**160 stones/day/operator**
- Internacional parameter:  
**61 stones/day/lapidary**
- National parameter:  
**30 stones/day/lapidary**

# GEOMETRICAL MODELLING FOR AN AUTOMATED FACETING MACHINE

## Problems Faced:

- Initial positioning of gem in device
- Vibration causing desalignment of gem
- Positioning tolerances
- Uneven wear of discs
- Adequation to different gems hardness
- Gem transfer for faceting other side

# GEOMETRICAL MODELLING FOR AN AUTOMATED FACETING MACHINE

## Advantages:

- Add value (US\$) and quality to designed Brazilian gems;
- Provide Brazilian competitiveness with the biggest global gemstones industries;
- Initial positioning of gem in device

# GEOMETRICAL MODELLING FOR AN AUTOMATED FACETING MACHINE

## MACHINE OPERATION

- **Cutting Disc:** Produce plan cuts in the gem surface;
- **Disc:** Responsible to produce brightness to the gem;
- **Mobile Table:** Perform all necessary movement steps of gem faceting.

# GEOMETRICAL MODELLING FOR AN AUTOMATED FACETING MACHINE

## Movementation

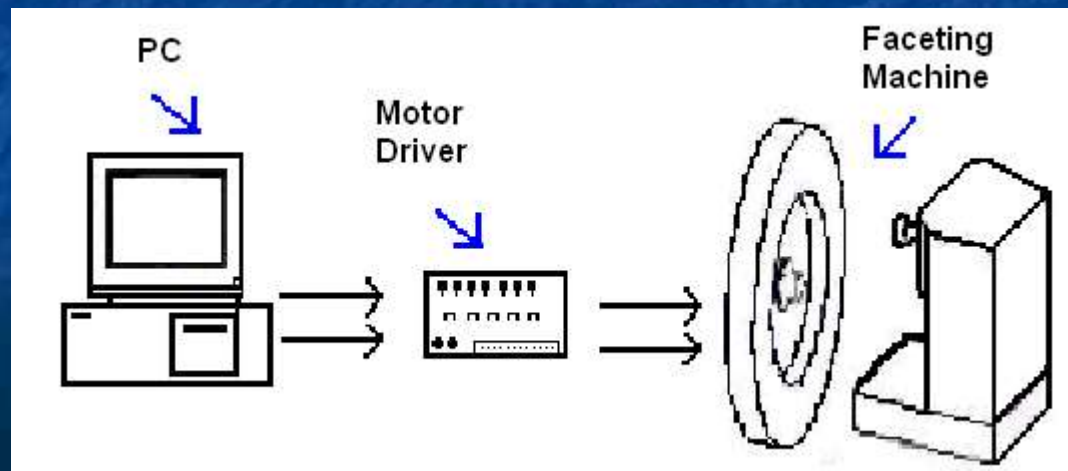

- Control of three independent motors allows linear and angular movementation;
- **1<sup>st</sup> Motor (X axis):** control rotation of the mobile table;
- **2<sup>nd</sup> Motor (Y axis):** control rotation angle of the gem;
- **3<sup>rd</sup> Motor (Z axis):** control distance between gem and the current disc;

# GEOMETRICAL MODELLING FOR AN AUTOMATED FACETING MACHINE

## Programming

- **CNC Tools:** G language (G code)
- **Specific Software:** List of procedures describes sequence of movements to be implement in each axis

# GEOMETRICAL MODELLING FOR AN AUTOMATED FACETING MACHINE

## Characteristics

- **Resolution:**  $1,8^{\circ}$ ;
- **Repetibility:** approximately 100%;
- **Temporal behavior:** deterministic;

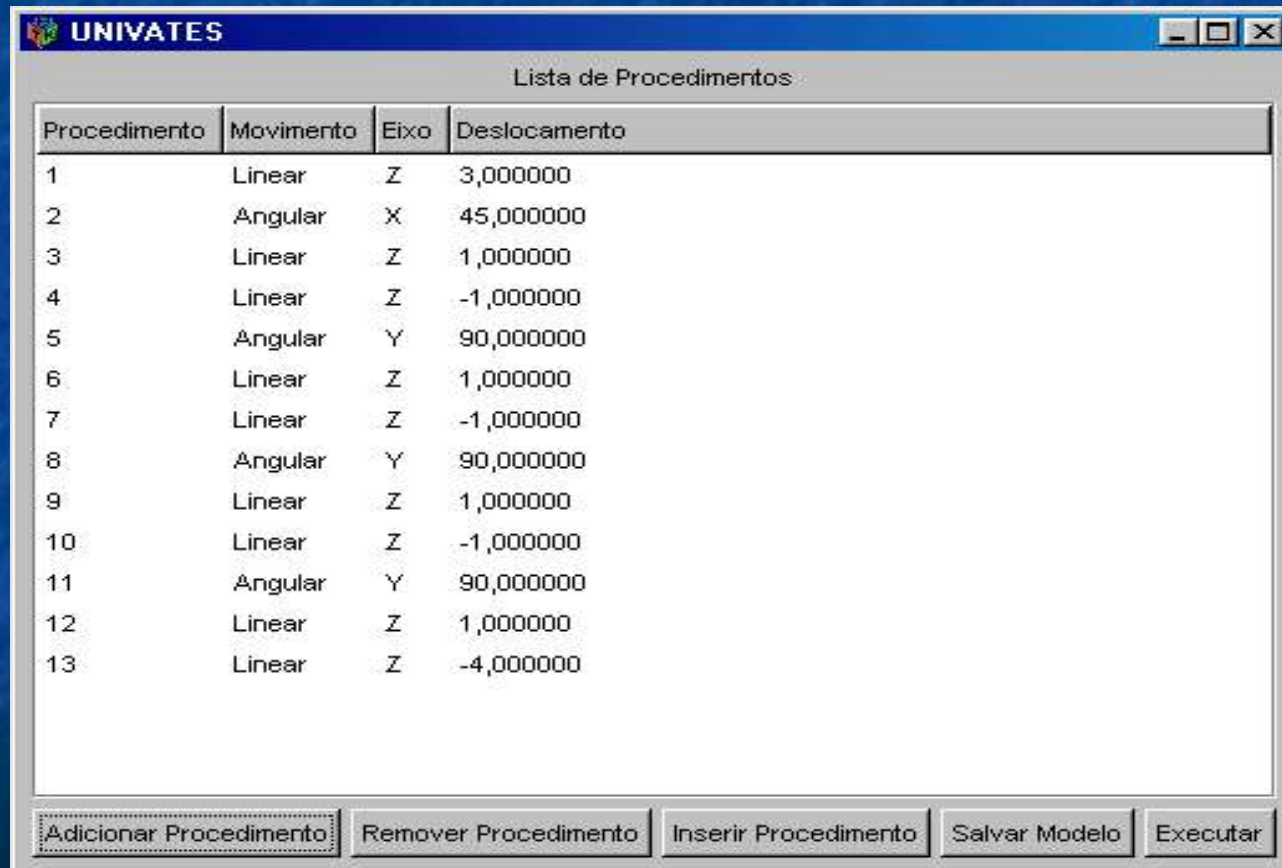

# GEOMETRICAL MODELLING FOR AN AUTOMATED FACETING MACHINE

## GEOMETRICAL MODELLING

- **Software built in C language;**
- **List of steps containing:**
  - **Corresponding axes: X, Y or Z;**
  - **Kind of Motion: linear or angular;**
  - **Displacement: cm or degrees;**

# GEOMETRICAL MODELLING FOR AN AUTOMATED FACETING MACHINE

Example for 4 Facetes of  $90^\circ$  with approach angle of  $45^\circ$  (video attached)

The screenshot shows a software window titled "UNIVATES" with a subtitle "Lista de Procedimentos". It contains a table with 13 rows of procedure data. The columns are "Procedimento", "Movimento", "Eixo", and "Deslocamento". The data is as follows:

Procedimento	Movimento	Eixo	Deslocamento
1	Linear	Z	3,000000
2	Angular	X	45,000000
3	Linear	Z	1,000000
4	Linear	Z	-1,000000
5	Angular	Y	90,000000
6	Linear	Z	1,000000
7	Linear	Z	-1,000000
8	Angular	Y	90,000000
9	Linear	Z	1,000000
10	Linear	Z	-1,000000
11	Angular	Y	90,000000
12	Linear	Z	1,000000
13	Linear	Z	-4,000000

At the bottom of the window, there are five buttons: "Adicionar Procedimento", "Remover Procedimento", "Inserir Procedimento", "Salvar Modelo", and "Executar".

## Automated Faceting Machine for Gems and Jewels

### Current status:

- 2<sup>nd</sup> prototype under tests
- Software in final stage
- Geometrical modelling not practice
- Series production in planning
- Forecast for conclusion: may 2006
